

Every finding in your audit, answered in your order

What we changed, how it was checked, and what your own regression checklist shows today.

PREPARED FOR	Kelvin
YOUR AUDIT	UI/UX & QA Audit of honeyx.monarchstack.com, dated 21 September 2026 — 28 numbered items and a 34-line regression checklist
THIS RESPONSE	25 September 2026
PREPARED BY	The PersonaGen team

28 / 28

numbered items answered
— 26 fixed, 2 answered by design (UX-004, ENH-004)

34 / 34

lines of your regression checklist ticked on real browsers

9

rounds of independent re-audit, three reviewers each, none of whom wrote code

3 × 10 × 7

browsers × screen sizes × user roles the reviewers covered

Kelvin — thank you for the audit. It was thorough, fair, and it found real problems. This document answers every item you numbered, in the order you gave it, then walks your regression checklist line by line with the evidence beside each line. Your checklist also caught one bug we had not seen; that is in here too.

CONTENTS

1. How we checked our own work

2. One rule that changed underneath several findings

3. Your findings, one by one — High, Medium, Low, Enhancements
4. Your regression checklist, ticked

5. What your checklist caught, and what else we fixed

6. Switching publishing on (your Zernio key)

7. Release and follow-ups

1. How we checked our own work

- After each batch of fixes, three separate reviewers went through the app with fresh eyes. Their job was to prove us wrong; they tried to reopen every one of your findings.
- They tested in Chrome, Firefox and Safari; on phone widths (320 to 414 pixels), tablets (768 and 1024) and laptops (1280 to 1605); and as every kind of user — owner, admin, manager, creator, viewer and a brand-new account. You could only test as Admin in Chrome at 1605 pixels; we covered the rest.
- They found things we had missed, so we fixed those too and ran the whole check again. Nine rounds in total.
- In every round since the sixth, all three reviewers reported the same thing: none of your findings could be reopened.

2. One rule that changed underneath several findings

The failure you hit — a generation failing on your own OpenRouter balance while the sidebar showed a healthy wallet — cannot happen any more. **Your own provider keys are no longer used for generation at all.** The wallet always pays, and every price says which wallet. The only key you bring is Zernio, because it is your publishing identity, not a cost. Two small exceptions charge the person clicking, not the workspace: the Brand Brief's text helpers and the persona wizard's drafts, a few cents each — and each of those buttons says so.

3. Your findings, one by one

HIGH

ID	WHAT YOU FOUND	WHAT WE DID	STATUS
UX-001	Ten text formats labelled "Free" although every format spends writing credit.	No format says "Free". Every text format shows its real writing cost — a Quote Card is \$0.08, the same figure the Billing page quotes. Checked: 41 Studio tiles, zero "Free" labels; Studio \$0.08 = Billing \$0.08.	FIXED
UX-002	Nothing says which wallet pays; the sidebar pill may show the wrong wallet.	The Studio header says "Generating here draws on your wallet". The generate dialog's footer says "Est. charge \$0.08 from your wallet" — or "from the [workspace] wallet" for a team member. The sidebar pill is labelled with the wallet it shows (the workspace name, or "Your wallet"). The Brand Brief's Generate / Spin / AI Enrich buttons and the wizard's Suggest directions / Generate options show their price and "charged to your own wallet". And, per the rule above, your own keys are never charged.	FIXED

ID	WHAT YOU FOUND	WHAT WE DID	STATUS
UX-003	Scrape & Populate is enabled with no Firecrawl key; Kie AI counts toward "0/2 set" while not wired up.	Scrape & Populate is disabled with a reason when Firecrawl is not available. The key list no longer asks for keys we do not need: Zernio is the only key you bring, providers that run on our keys are listed as "Included", and a provider that is not wired up is not counted. Checked: button disabled with its reason; counters read "Publishing 0/1 set · Included 4 · No key to bring 2".	FIXED
UX-004	No in-product way to add credit; all four tiers "Coming soon".	Card payments are still switched off — a business decision, as you noted. What we did instead is what you recommended: each tier has its own "Ask us to load \$10 / \$25 / \$50 / \$100" button. The request reaches us directly; when we approve it, the credit lands in your wallet and Billing shows a line saying it arrived.	ANSWERED
UX-005	Zernio setup is a dead end; no screen links to the guide; nobody says who provides the first key.	The Zernio row now says plainly: "Zernio bills your own Zernio account per connected account (2 free)", with a "Where do I get a Zernio key?" link to the guide. The dashboard checklist's "Add key" step opens that exact row. If a persona has no key yet, its Connections tab says so and links to both the row and the guide. Section 6 has the two-minute version.	FIXED
A11Y-001	The persona Active toggle cannot be reached by keyboard and has no name.	Each toggle is a real switch: Tab reaches it, it is named ("Active: Theo Marsh"), it announces on/off, and Space operates it. Checked: 5 of 5 toggles reached by Tab in Chrome, Firefox and Safari, each with a name and a state.	FIXED

MEDIUM

ID	WHAT YOU FOUND	WHAT WE DID	STATUS
QA-001	Published, persona and generation counts disagree between Dashboard, Admin and the persona page.	Each metric now comes from one source and every card names its period ("published in the last 7 days", "switched on to generate · 3 of 6 connected"). The reviewers checked the three pages against the database in every round since round 6.	FIXED
UI-001	A persona with no handle shows a stray "·" at the start of its row.	The separator only appears between two values. One empty-value convention across the product.	FIXED
UX-006	The persona list pushes Review Queue, Calendar, Docs, Billing and Settings out of view.	The primary destinations sit above the persona list, so they never move. Checked at 1280×720, 1366×768 and 1605×973: Settings and Docs visible with no sidebar scrolling.	FIXED
UX-007	The reference-photo failure banner tells you to retry but has no retry.	The banner has a Retry button.	FIXED
UX-008	Market defaults to Australia.	Market defaults to Global, and the field sits above the Generate button.	FIXED

ID	WHAT YOU FOUND	WHAT WE DID	STATUS
UI-002	The Settings section switcher has no tab semantics or selected state.	It is a proper tab list: 8 tabs, one selected, announced as such. Checked in Chrome, Firefox and Safari.	FIXED
UI-003	The persona page lists 13 platforms, the dashboard 6, with different names ("X" vs "Twitter/X").	Both pages read from one platform list with one set of names.	FIXED
UX-009	Escape does not close the user menu.	Escape closes it and puts focus back on the button. Checked in Chrome, Firefox and Safari.	FIXED
UX-010	The Review Queue says "65 of 66 shown" without saying what is hidden or why.	The count names the filter that is hiding items, and the hidden items are one click away.	FIXED
A11Y-002	The persona list looks like a table but is not one; only one row was marked.	The list carries full table semantics: a table, a header row, and every row and cell marked, so a screen reader reads it row by row and knows which column each value belongs to. Checked in Chrome, Firefox and Safari: every row has its cells.	FIXED
RESP-001	At exactly 768px the shell is in mobile mode but the page masthead is still in desktop mode.	The masthead crosses at 768px with the shell, and the Review Queue's own phone rules moved from 767 to 768, so nothing in the product keys on 767 any more. Checked at 767, 768 and 769 in Chrome, Firefox and Safari: 767 and 768 identical, 769 desktop.	FIXED

LOW

ID	WHAT YOU FOUND	WHAT WE DID	STATUS
QA-002	The pill shows ₦3,131.00 while Billing shows ₦3,131.25.	The balance is formatted once, on the server, to real cents; the pill and Billing show the identical amount. Checked in three browsers and, by the reviewers, in yen, won, pounds and euros.	FIXED
UI-004	Wizard progress is visual only.	The current step is marked and read out as "Step 1 of 3". Checked in three browsers.	FIXED
UX-011	Empty sign-in submit shows the failed-credentials message.	It now says: "Enter your email and password to sign in. Fill in both fields and try again."	FIXED
UX-012	No password reset link.	"Forgot your password?" sits on the sign-in form and leads to the reset page. See section 7 for the email side.	FIXED
UI-005	Admin shows US-style dates next to PHP currency.	Dates and times follow your language and your time zone on every page, Admin included.	FIXED

ENHANCEMENTS YOU SUGGESTED

ID	YOUR SUGGESTION	WHAT WE DID	STATUS
ENH-001	Put the docs where the failure happens.	Error messages that have a matching guide link to it, and the provider row links to its guide.	DONE

ID	YOUR SUGGESTION	WHAT WE DID	STATUS
ENH-002	A setup checklist on the dashboard.	The dashboard has a checklist driven by real state, and it can be hidden.	DONE
ENH-003	Show cost and funding source before the click.	The generate dialog's footer: "Est. charge \$0.08 from your wallet". Every other paid button — identity kit, profile photo, Brand Brief helpers, wizard drafts — carries its price and payer the same way.	DONE
ENH-004	Reconsider five Review Queue views.	Kept for now, as you framed it — an observation, not a defect. We will look at usage before investing further. All five were included in the accessibility checks.	ANSWERED
ENH-005	Let the dashboard explain its own zeroes.	Each card says what it counts and for what period.	DONE
ENH-006	Name the workspace in the balance pill.	The pill reads "UX Audit Co \$120.00" for a workspace, "Your wallet" for a solo account.	DONE

4. Your regression checklist, ticked

You asked for these to be ticked on a real browser, not in a code review. They were: Chrome, Firefox and Safari, against the build that carries every fix. "3 browsers" means all three passed.

COST AND FUNDING

YOUR LINE	RESULT	EVIDENCE
No format in the Studio displays Free unless it genuinely costs nothing	✓	41 Studio tiles, zero "Free" labels
Text format cost in the Studio matches the figure quoted on Billing	✓	Quote Card \$0.08 in the Studio; "about \$0.08" on Billing
Generate action names the funding source before the run starts	✓	Dialog footer "Est. charge \$0.08 from your wallet"; Studio header names the wallet; Brand Brief and wizard buttons show their price and "charged to your own wallet"
Sidebar balance pill names which wallet it shows	✓	"UX Audit Co \$120.00" for a workspace member; "Your wallet" for a solo account
Sidebar balance and Billing balance display the identical amount to two decimals	✓	\$120.00 on both, 3 browsers
A user with a saved OpenRouter key sees that their own key will be charged	✓	Premise removed: no OpenRouter key is collected any more; the wallet always pays

SETUP JOURNEYS

YOUR LINE	RESULT	EVIDENCE
Every provider row in Settings links to its guide	✓	The one row you bring a key for (Zernio) links to its guide

YOUR LINE	RESULT	EVIDENCE
Zernio panel states where the first key comes from and who provisions it	✓	"Zernio bills your own Zernio account per connected account (2 free)" + "Where do I get a Zernio key?"
Scrape & Populate is disabled, with a reason, when Firecrawl is unset	✓	Disabled; the reason is on the button
Kie AI no longer counts toward the Media Generation setup counter while unimplemented	✓	No such counter remains; providers that run on our keys are listed as "Included"
Saving a provider key shows a success state and the status flips to Saved	✓	Zernio row: "Not set" → "Saved" with a success message — after fixing the bug this line caught (section 5)

DATA CONSISTENCY

YOUR LINE	RESULT	EVIDENCE
Published count is identical on Dashboard, Admin and the persona page	✓	Reviewers compared the three pages with the database, rounds 6–9
Workspace published total is greater than or equal to any single persona total	✓	Same check
Persona count matches between Dashboard and Admin, or Hermes is intentionally excluded from both	✓	Same check
Dashboard generation counts are non-zero for personas with activity in the Admin log	✓	Same check
Spend uses one currency per surface, with the period labelled	✓	"3 Active Personas — switched on to generate · 3 of 6 connected"; "5 Posts This Week — published in the last 7 days"

ACCESSIBILITY

YOUR LINE	RESULT	EVIDENCE
Tab reaches the Active toggle on every persona row	✓	5 of 5, 3 browsers
Screen reader announces the Active toggle with the persona name and its state	✓	"Active: Theo Marsh", on/off announced, 3 browsers
Active toggle operates with Space or Enter	✓	Space flipped the state and flipped it back
Settings section switcher exposes tab roles and a selected state	✓	Tab list, 8 tabs, one selected, 3 browsers
Escape closes the user menu and returns focus to the trigger	✓	3 browsers
Persona list announces column and row associations	✓	Table, header row, every row and cell marked, 3 browsers
Wizard announces step position	✓	"Step 1 of 3, current: 1 Identity", 3 browsers

RESPONSIVE

YOUR LINE	RESULT	EVIDENCE
At exactly 768px the masthead and the shell are both in mobile mode	✓	767 and 768 identical, 769 desktop, 3 browsers
Persona list is usable at 390px with no horizontal page scroll	✓	0 px overflow, 3 browsers
Persona list is usable at 768px	✓	0 px overflow, 3 browsers
Sidebar nav reaches Settings and Docs without scrolling past 14 personas	✓	Primary destinations sit above the persona list; visible with no scrolling at 1280×720, 1366×768, 1605×973
Dialogs and dropdowns stay inside the viewport at 375px	✓	User menu inside 375×667; reviewers checked dialogs and drawers at 320–414 in every round

SIGN-IN

YOUR LINE	RESULT	EVIDENCE
Empty submit shows empty-field copy, not failed-credentials copy	✓	"Enter your email and password to sign in. Fill in both fields and try again." — 3 browsers
Deep link to /dashboard returns to /dashboard after sign-in	✓	/billing while signed out → sign-in → back on /billing
Password reset is reachable from the sign-in form	✓	"Forgot your password?" → the reset page, 3 browsers
Sign-in layout holds at 375px	✓	0 px overflow, 3 browsers

REGRESSION GUARDS

YOUR LINE	RESULT	EVIDENCE
No new console errors on any audited route	✓	All 11 routes, as owner, as admin and signed out: zero console errors, zero failed requests, zero 4xx/5xx
A single dashboard load still makes one API call, not several	✓	One call

5. What your checklist caught, and what else we fixed

Your checklist found a real bug. The line "Saving a provider key shows a success state and the status flips to Saved" failed when we ran it: since 17 September, saving any provider key ended in a database permission error, so nobody could have added a Zernio key. Fixed and re-checked — the row now goes from "Not set" to "Saved" with a success message. Thank you for that line.

Things the reviewers caught before they reached anyone. One of our own fixes could have sent a post to Instagram twice; another opened the wrong Settings panel; the Brand Brief and wizard buttons were still unpriced; the Back button could jump the page after you had started scrolling; the week view's calendar chips clipped their keyboard focus ring; one top-up pack showed two converted amounts. All fixed and re-checked with the reviewers' own tests.

The last small things, also fixed. Calendar chips on tablets now shorten long text with "..." instead of cutting it; persona initials on coloured circles now meet the contrast standard on every screen that shows them; the three interactive illustrations in the Docs now fit the article column on 1366-pixel laptops; and in countries whose money also uses the "\$" sign (Mexico, Chile and others) US-dollar prices now read "US\$" so they cannot be mistaken for local money.

6. Switching publishing on (your Zernio key)

Nothing is needed from you to use the product. Publishing to social accounts runs through Zernio, and a Zernio key is the one thing only the account holder can add — it takes about two minutes:

1. In PersonaGen, open **Docs** → "**Get publishing working (the Zernio key)**". The Settings row and the dashboard's "Add key" step both link straight to it.
2. The guide walks you through it: sign in at zernio.com with Google, copy the API key, paste it into Settings → Provider API Keys → Zernio, and press Save Key. The free Zernio account includes 2 connected accounts.
3. Then connect a platform on any persona's Connections tab. That is all.

7. Release and follow-ups

Release. Every change in this document is committed, built and verified. The code is on the main branch as of 25 September 2026 and reaches honeyx.monarchstack.com with the production deploy that follows this document.

Password-reset emails. The "Forgot your password?" link and the reset page work. Sending the email itself needs a mail service on the server, which is being set up; until it is on, the reset page says so and offers "Ask us to help you sign in", which reaches us directly.

Questions on any item? Reply with its ID (for example UX-005) and we will show you exactly what changed and where.

The PersonaGen team · 25 September 2026
